

Notion Integration

Databases, Auto-Logging, Page Structure

March 31, 2026

ClawCraft Project Reference

Overview

Notion serves as the project management and data tracking layer for ClawCraft. Four databases track scenes, renders, tasks, and milestones. The blender plugin automatically pushes data to Notion after every render.

Notion Page ID: 32f366192ab580269bc9d49f3827e498

Token and all database IDs stored in ~/src/openclaw/.env (loaded by docker-compose into the container environment).

Databases

Scenes Database

ID: 32f36619-2ab5-8123-aedc-edeb780ff

6 rows, pre-populated. One per planned scene.

- **Name (title)** Scene identifier (e.g., fridge_portal)
- **Status (select)** Not Started / In Progress / Complete
- **Iterations (number)** Auto-updated by blender tool after each render
- **Best Render (files)** Upload best render image manually
- **Notes (rich_text)** Free-form notes

Renders Database

ID: 32f36619-2ab5-8149-af30-c540c854aff4

Empty initially. Auto-populated by blender tool on every render. One row per render.

- **Name (title)** Render ID (e.g., render_001)
- **Scene (relation -> Scenes)** Links to parent scene row
- **Iteration (number)** Iteration number within the scene
- **Outcome (select)** success / partial / failure / happy_accident
- **Render Time (number)** Seconds to render
- **Prompt (rich_text)** Original user prompt (truncated to 2000 chars)
- **Workflow Observation (rich_text)** LLM's process observation (truncated to 2000 chars)
- **Quality Rating (number)** 1-5, set later via /rate command
- **Image URL (url)** Link to render image (if hosted)
- **Date (date)** Render timestamp

Tasks Database

ID: 32f36619-2ab5-8166-82ec-f09730324655

12 tasks pre-populated for Week 2.

- **Task (title)** Task description
- **Status (select)** Not Started / In Progress / Done
- **Due Date (date)** Target completion date
- **Priority (select)** Urgent / High / Normal
- **Do Today (checkbox)** Flag for daily focus

Milestones Database

ID: 32f36619-2ab5-81cf-ab76-fc564d44fcf5

30 milestones across Weeks 1-5. Week 1 all marked complete.

- **Milestone (title)** Milestone description
 - **Week (select)** 1 / 2 / 3 / 4 / 5
 - **Due Date (date)** Week end date
 - **Complete (checkbox)** Done flag
-

Auto-Push Implementation

In blender-tool.ts, the function `pushRenderToNotion()` fires after `writeLog()` in the `handleRender` function. It's called as a fire-and-forget promise with `.catch()` -- Notion failures are logged to console but never block the render response.

Flow:

1. Read `NOTION_TOKEN`, `NOTION_RENDERERS_DB`, `NOTION_SCENES_DB` from `process.env`
2. `POST /databases/{SCENES_DB}/query` with filter: Name title equals scene_id
3. Extract scene page ID from query results (null if not found)
4. `POST /pages` to create Renders row with all properties + Scene relation
5. `PATCH /pages/{scenePageId}` to update Iterations number + Status to 'In Progress'

API Details

- Uses Node's built-in `fetch()` (Node 22+), not `@notionhq/client`
 - Notion API version: 2022-06-28
 - Auth: Bearer token from `NOTION_TOKEN` env var
 - Prompt and workflow_observation truncated to 2000 chars (Notion rich_text limit)
 - If scene not found in Scenes DB, render row is created without Scene relation
-

Notion Page Visual State

The Notion page has been partially filled with project overview sections.

Completed sections:

- Title heading: 'ClawCraft -- AI-Assisted 3D Art Pipeline'

- Callout: student info (name, course, university)
- The Concept: 3 paragraphs (what it is, art direction, prior project context)
- Core Pipeline: code block diagram + 3 explanation paragraphs
- Skills & Plugins: 3 tool descriptions, 5 skill bullets, packages, infrastructure
- Logging & Data Collection: 3 paragraphs on auto-logging system

NOT yet added:

- Planned Scenes section (6 scenes with descriptions)
- Deliverables & Deadlines section
- Professor Feedback section
- Known Technical Issues section
- 'Project Tracking' header before databases
- Plan database: old academic rows archived, new practical milestones not created
